

BOXX Features the Display Technology of Cine-tal

AUSTIN, TEXAS, June 22, 2009—BOXX Technologies, an innovator in high-performance computing systems for visual effects (VFX), post production, design professionals, and advanced visualization, today announced that it has added [Cinimage](#) monitors to its line of professional motion media workstation accessories. Developed by Cine-tal, the Cinimage product family has revolutionized critical reference monitoring for digital cinema and video applications.

“The performance and features found in Cinimage make it the perfect accessory to our line of motion media workstations and a welcome addition to our stellar lineup of high performance options,” said Shoab Mohammad, Director of Marketing and Business Development at BOXX.

Bundled with the BOXX RTX Series, redBOXX II or 3DBOXX workstations, the Cinimage monitors feature advanced image data processing, including signal routing, framestores, color processing, digital signal monitoring, and measurement. Cinimage also includes a powerful image processor that generates real time data about the digital image stream, and utilizes that data to generate waveforms, vectorscopes, gamut information and status of the incoming signal.

“Integrated into the Cinimage product line is the company’s cineSpace color management and calibration software. The integrated cineSpace technology provides precision control of the wide gamut color primaries, creating a perfect reference for DCI, HD and SD monitoring. Cinimage is the only monitoring system utilizing an optimized combination of 3D LUTs 1D LUTs and 21 bit color matrices to provide the highest precision of monitor calibration, display system emulation, and color pre-visualization,” said Rob Carroll, company President and CEO. “Cinimage’s renowned features, combined with the outstanding performance of BOXX workstations, take post production to a whole new level.”
